

# Rare World

## *Towards Technology for Rare Diseases*

While there is a small number of people living with a rare disease, **10% of the world's population has some sort of rare disease.**

We conducted an interview study with individuals with rare diseases from around the world to **understand common problems and experiences to be supported through design.**

In phase 2, we will **work closely with patients and physicians through a series of online workshops to design a sociotechnical solution** to these challenges, taking into account the solutions provided in previous studies of people with common chronic illnesses.
